在树莓派上翻墙

Posted on <u>二月 13, 2013</u>

安装tor:

sudo pacman -S tor

编辑/etc/tor/torrc

修改绑定的端口与IP地址,为管理端口设置

ControlPort 9051

用tor –hash-password命令为管理密码生成Hash值并填入:

HashedControlPassword 16:3B22F50E5701395C60D8954EFF7E80C6F7093F5F9BD7C5F065C3A4871A 需要的话添加Socks5Proxy

重启tor服务:

systemctl restart tor

安装polipo:

sudo pacman -S polipo

```
参考/etc/polipo/config.sample设置/etc/polipo/config
proxyAddress = "192.168.54.88"
proxyPort = 8118
allowedClients = "192.168.54.0/24"
socksParentProxy = "localhost:9050"
socksProxyType = socks5
参考/etc/tsocks.conf.simple.example设置/etc/tscoks.conf:
local = 192.168.54.0/255.255.255.0
server = 127.0.0.1
server type = 5
server port = 9050
需要安装python2来支持Tor的控制台管理软件Arm运行(不兼容python3):
pacman -S python2
手工安装Arm:
cd ~
https://archive.torproject.org/arm/arm-proxy=192.168.54.88:28118 wget -no-cache -no-dns-cache -no-dns-ca
1.4.5.0.tar.bz2
tar jxvf arm-1.4.5.0.tar.bz2
ln -s /usr/bin/ ./python
cd arm
```

PATH=~:\$PATH sudo ./install

提示安装成功到/usr/share/arm后,清除多余的文件:

cd..

rm python

rm arm-1.4.5.tar.bz2

rm -Rf arm

编辑/usr/bin/arm,将两处python修改为python2。

根据/usr/share/doc/arm/armrc.sample编写~/.arm/armrc并设置正确的startup.controlPassword与startup.interface.port

出于安全考虑,将armrc设置为仅本人可访问:

chmod 600 armrc

最后,运行arm检查是否成功。
